

GutPlus® Virsorb

enhances immune status and litter performance of Porcine Epidemic Diarrhea virus (PEDV) infected sows

Trial conducted in 2024, at Cuirassier Daping Pig Farm, Guizhou, China

PEDV infection leads to intestinal damage and diarrhea in piglets. Current vaccines offer limited protection, highlighting the need for alternative strategies. GutPlus® Virsorb, a multi-strain Bacillus-based probiotic, helps alleviate PEDV and rotavirus infections while inhibiting Gram+ and Gram- bacteria.

OBJECTIVE

To evaluate the effect of GutPlus® Virsorb supplementation in late gestation and lactation diets on the immune status and litter performance of PEDV infected sows under field conditions.

ANIMALS

Large white × Landrace crossbred sows (parity 2–7, 8 sows / treatment) and their litters (12 suckling piglets / litter).

TREATMENTS

Duration: 12 days before and 21 days after farrowing

T1: basal diet, unchallenged

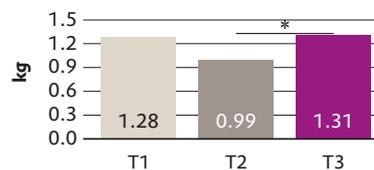

T2: basal diet, PEDV infected

T3: basal diet + GutPlus® Virsorb (500 g/t, 1E6 CFU/g), PEDV infected; piglets received 3–5 ml GutPlus® Virsorb on day 2–9 of life via oral gavage.

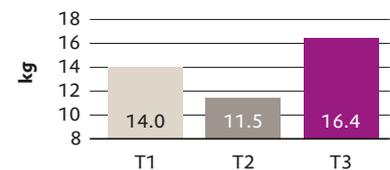

RESULTS

GutPlus® Virsorb improved average birth weight (+32%), average litter weight (+43%, day 1), body weight (+31%, day 21) and reduced mortality rate (-68%, day 1–21), vs. infected group

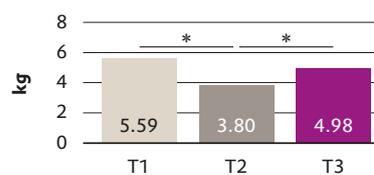

Average birth weight

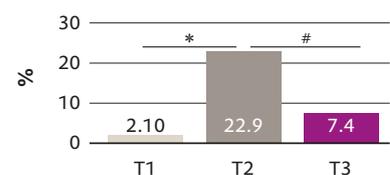

Average litter weight/sow (day 1)

Body weight of piglets (day 21)

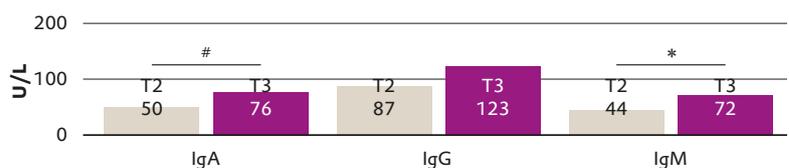

Mortality rate of piglets (day 1–21)

*tend to be significant, P < 0.1; *significant, P < 0.05

GutPlus® Virsorb improved colostrum IgA and IgM (+52 to 64%)

Immune Antibody in Colostrum (1d postpartum)

*tend to be significant, P < 0.1; *significant, P < 0.05

CONCLUSION

GutPlus® Virsorb supplementation in late gestation and lactation diets:

1. Effectively enhances immune status and improves litter performance of PEDV-infected sows
2. Boosts profitability by improving overall production efficiency.
